         Claim 1; Columns 37-42; 32pp; English.
         Enterohaemorrhagic E.coli (EHEC) associated with enterohaemorrhagic colitis, haemolytic uremic syndrome and mesenteric adenitis have been found to carry a hlyA gene and a hylB gene, separated by an intergenic region. The hly genes and the intergenic region are absent from bacteria not associated with these diseases and so provide a useful target for detecting EHEC pathogens, esp. 0157:H7 serotype E.coli. The present sequence is that of the protein encoded by the EHEC hlyA gene.

XX
            AAW22151-W22161 represent A. pleuropneumoniae RTX (repeat in toxins)
           toxins. These sequence are encoded by the apxICA, apxIBD, apxIIAB'C, and apxIIIABCD genes (see AAT73217-T73220), and can be expressed by microorganisms used in the preparations of the invention. The preparations are bacterial preparations comprising one or more isolated
           preparations are bacterial preparations comprising one or more isolated and purified strains of a microorganism that produces one or more RTX toxins, where the strains have at least one cell-associated RTX toxin. The preparations are used for production of vaccines for the prophylaxis and treatment of infectious diseases caused by microorganisms that produce RTX toxins, where the strains have been attenuated or inactivated. The vaccines are preferably against Actinobacillus pleuropneumoniae infection (swine pleuropneumonia). It has been found that A. pleuropneumonia produces significant quantities of cell-associated RTX toxins when cultured under certain conditions, and
           that the whole-cell protein composition of the cultures corresponds to the whole-cell protein profiles obtained from cells recovered at necropsy from the pleural fluid of infected swine. Vaccination with a bacterin prepared from heat-inactivated cultures having significant quantities of cell-associated RTX toxins give significant protection of swine against challenge with homologous strains.

         Claim 13; Fig 5; 87pp; English.
          Plasmid pAA352 is derived from pAA114, a clone isolated from a genomic library of P. haemolytica. The protein encoded by the plasmid, "new leukotoxin" or "LKT 352" is 98% homologous to authentic leukotoxin. LKT 352 and pref. antigenic fragments of it, authentic leukotoxin. LKT 352 and pref. artigenic fragments of it, authentic leukotoxin. LKT 352 and pref. artigenic fragments of it, authentic leukotoxin. LKT 352 and pref. artigenic fragments of it, authentic leukotoxin. They can be used to protect cattle from respiratory diseases. They can also be used to produce antibodies for immunoaffinity purificn. of further proteins. [Fig. contg. sequence v. poor] purificn. of further proteins. [Fig. contg. sequence v. poor] See also AAR10890, AAR20909, AAR10910 and AAQ10783.
